

POWERING NETWORKS WITH IP BANDWIDTH

High-speed resilient Internet access has become a critical requirement for organisations. In recognition of this, DXI has implemented and operates at its data centres, diversely routed Internet connections with multiple bandwidth providers and peers with numerous Tier 1 ISP's. DXI offer IP traffic routing services, ensuring 100% efficiency and bandwidth availability to its clients. As part of our service, we ensure that the configuration meets your requirements and traffic routing is based upon your business needs.

DXI provides flexible bandwidth connectivity options based on 'Committed Data Rate' through to 'On Demand' services. Clients may wish to opt for a hybrid CDR with a burst facility. Port usage statistics along with a range of billing options ensure the client will only pay for what they use.

Various access options are available, ranging from xDSL through Leased Line services to Dark Fibre at speeds up to multi Gb/second. Resilient access is provided through multi-homed connections to our multiple data centres. Clients are connected directly into our 256GB non-blocking core switches at speeds up to 10GB. All service delivery components between the customer and the Internet are optimally configured and constantly monitored.

DXI offer complete Internet access solutions, including the provision, deployment and management of Customer Premise Equipment (CPE), such as routers, firewalls and switches.

Features

- World-class Internet connectivity
- 24x7x365 Network management and support
- Advanced monitoring/portal options

Benefits

- Rapid provisioning
- BGP Consultancy Service
- Carrier independent
- Resilient
- Bespoke solutions
- Predictable costs and flexible terms
